

TRAFFIC SAFETY FACTS

Speeding-Related Collisions

—Katherine L. Chen, Bor-Wen Tsai, Garrett Fortin, and Jill F. Cooper—

INTRODUCTION

A speeding-related collision is defined as one where a driver is speeding, racing, driving too fast for the conditions, or driving in excess of the posted speed limit. In the United States, over one in four (26.2 percent) fatalities involved speeding, a steady decline from a decade ago. Speeding reduces a driver's ability to steer safely around curves or objects, reduces the amount of time a driver has to react to a dangerous situation, and extends safe stopping distances. Analyses presented in the police traffic services program area refer to speeding-related fatal and serious injuries.

CALIFORNIA FACTS

CALIFORNIA DATA

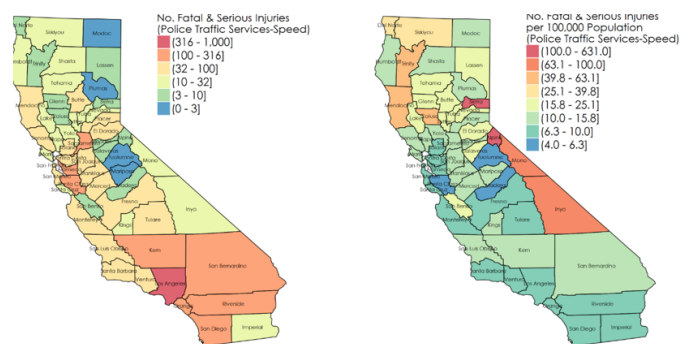

- In California, there were 1,070 people killed in speeding-related traffic collisions in 2017, a 7.0 percent decrease from 1,151 in 2016, and a 7.9 percent increase from 992 in 2013.
- In 2017, 29.7 percent of California's 3,602 motor vehicle fatalities were speeding-related. California had the highest number of speeding-related fatalities in the nation in 2017.
- The 2018 OTS Traffic Safety Survey reported that 56.9 percent of drivers surveyed perceive that it is safe to drive 10 miles over the speed limit on freeways. When asked about the safety of driving 5 miles over the speed limit in a residential area, only 33.2 percent of drivers surveyed believe it is safe. Of young adult drivers age 18 to 24, 50.0 percent believe it is safe to do so. The survey also found speeding and aggressive driving was the most commonly mentioned safety problem on California roadways, comprising 19.4 percent of responses.
- The highest number of speeding-related fatal and serious injuries were in Los Angeles County, followed by San Diego, San Bernardino, Riverside, Orange, Sacramento, Alameda, Kern, and Santa Clara counties.
- The highest rate of speeding-related fatal and serious injury per population were concentrated in more rural parts of California in Alpine and Sierra counties, followed by Mono and Inyo counties.

CALIFORNIA DATA (continued)

- Over one-third (36.5 percent) of speeding-related crashes were rear end collisions. Other common crash types for speeding-related collisions were hitting an object at 21.7 percent and overturned vehicle at 13.7 percent.
- About one-third (33.9 percent) of fatal and serious injuries from speeding-related collisions occurred on weekends.
- Fatal and serious injuries from speeding-related collisions occurred frequently during the weekday evening commute hours between 3pm and 9pm, accounting for 35.4 percent of fatal and serious injuries on weekdays. Nearly half (41.8 percent) of all fatal and serious injuries from speeding-related collisions occurred over the weekend from 6PM Friday through 6AM Monday.
- The vast majority (73.6 percent) of fatal and seriously injured speed-related collision victims were males. Almost half (49.2 percent) of all fatal and seriously injured speed-related collision victims were aged 15 to 34.
- Race was not reported for 23.2 percent of the speed-related fatalities. Of the 822 fatalities with a known race, 81.1 percent (or 667) were white.
- About two-thirds (67.0 percent) of speed-related fatalities occurred in urban areas compared to 32.9 percent on rural roads. However only about 15.9 percent of travel took place on rural roads in 2017.
- Over half of the fatal injuries from speed-related collisions occurred in passenger vehicles (59.0 percent), followed by motorcycles at (25.0 percent).

Time of Day and Day of Week for Speeding-Related Fatal and Serious Injury Victims, 2017
